

Proviflush

The sow booster that changes the effect of season

During summer and early autumn many herds experience seasonal infertility. On the farm this gives rise to an increased weaning-to-estrus interval and, somewhat later, can increase the number of repeat breeders (Figure 1) while decreasing litter sizes. Proviflush is a carefully selected blend of antioxidants, B vitamins, trace elements and yeasts developed to support sows during this period of the year. Proviflush should be used from April to August so as to maximise the benefits.

Proviflush to support the sow

Benefits:

- Increased oxidative protection
- Enhanced moulting process
- Reduced number of sows coming back into heat
- Increased number of live born piglets

Feeding recommendations:

- When used as a top-dress: 30 grams per sow, per day
- When used in a premix: 10 kg per ton during gestation and 5 kg per ton during lactation
